

REMARKS

Claims 1-31 are pending. A set of formal replacement formal drawings is being submitted herewith. No new matter has been added.

Initially, although the Examiner has indicated that the various references cited in the previously-filed Information Disclosure Statements have been considered, and the box is checked off indicating that the forms PTO-1449 were returned with the Office Action, these initialed forms were not attached to the Action. It is requested that the initialed PTO-1449 forms be attached to the next Office Action.

Claims 1-31 were rejected under 35 U.S.C. 112, second paragraph, as indefinite. The position has been taken that the terms “canonical path” and “clique” are unclear. Applicants comment as follows.

The concise Oxford English Dictionary, Eighth Edition, 1991, defines the word “canonical” as “authoritative, standard, accepted.” “Clique” is defined as “a small exclusive group.” The technical website www.webopedia.com, an online computer dictionary, defines “canonical” similarly, as “authoritative or standard, conforming to an accepted rule or procedure.” In the specification, these terms are used in accordance with these understood definitions. The nodes in the network are arranged in “cliques,” or groups, in the manner specified (in particular, two “cliques” being connected by a single path). Message distribution throughout the network is via “canonical” paths, i.e., a path that is authoritative, standard or conforms to an accepted rule, the “canonical” path being defined in the claim itself as the optimal route between nodes following three rules. As explained in the first few pages of the description of the preferred embodiment, by following the message flow rules required for a path to be considered a “canonical” path, the appropriate structure of network is a set of “cliques” or groups. These are two ways of looking at the same concept. It is believed clear from the above that the terms were used in a clear and understandable manner, and the claims

using the terms are believed clearly to be definite and conform to Section 112, second paragraph. Withdrawal of the rejection is requested.

As to the requirement under 1.105, the appropriate background to the invention is any example of distributed dealing systems. Such systems are discussed in the background section and include the Togher et al. U.S. Patent 5,375,055, now assigned commonly with the present application. The international counterpart publication of the Togher et al. patent, WO 93/15467, was made of record in the IDS filed on March 29, 2001. The background art known to the applicants in the related field has already been identified in the IDS submissions filed previously.

Applicants cannot submit any background information as to electronic trading systems with “canonical paths” or “cliques” because these concepts are part of the very invention to which the claims are directed and do not form part of the background knowledge.

As to identifying specific improvements of the claims over the prior art, there is no requirement under U.S. Patent law to identify specific improvements. Applicants is entitled to a patent unless the Patent Office identifies statutory reasons to the contrary, such as identifying a statutory basis to deny such grant. There is no requirement either that claims be written in Jepson format, with the improvement identified. For this reason, Applicants decline the Examiner’s invitation. Since the Wilton reference was not cited in any rejection, it will not be commented upon by the Applicants.

Application No.: 09/602,498

Docket No.: E3331.0467/P467

In view of the above, each of the presently pending claims in this application is believed to be in immediate condition for allowance. Accordingly, the Examiner is respectfully requested to pass this application to issue.

Dated: August 30, 2004

Respectfully submitted,

By Joseph W. Ragusa
